

BEFORE THE PUBLIC SERVICE COMMISSION OF SOUTH CAROLINA
COLUMBIA, SOUTH CAROLINA

PROCEEDING #18-11733

JULY 23, 2018

10:02 A.M.

ALLOWABLE EX PARTE BRIEFING - ND-2018-19-E

Duke Energy Carolinas, LLC, and Duke Energy Progress, LLC - Request for an Allowable Ex Parte Briefing Regarding Managing Duke Energy Hydroelectric Projects

TRANSCRIPT OF ALLOWABLE
PROCEEDINGS

EX PARTE BRIEFING

COMMISSION MEMBERS PRESENT: Comer H. 'Randy' RANDALL, *Chairman*; and COMMISSIONERS John E. 'Butch' HOWARD, Elliott F. ELAM, Jr., Swain E. WHITFIELD, Thomas J. 'Tom' ERVIN, and G. O'Neal HAMILTON

ADVISOR TO COMMISSION: Joseph Melchers, Esq.
General Counsel

STAFF: James Spearman, Ph.D., Executive Assistant to Commissioners; David W. Stark, III, Esq., Legal Advisory Staff; Douglas K. Pratt, Thomas Ellison, and John Powers, Technical Advisory Staff; Randy Erskine, Information Technology Staff; Jo Elizabeth M. Wheat, CVR-CM/M-GNSC, Court Reporter; and William O. Richardson and Calvin Woods, Hearing Room Assistants

APPEARANCES:

HEATHER SHIRLEY SMITH, ESQUIRE,
representing and **Kodwo Ghartey-Tagoe** [President,
South Carolina / Duke Energy], **Jeff Lineberger**
[Director, Water Strategy and Hydro Licensing], and
Randy Herrin [Vice President, Carolinas Regulated
Renewables / Duke Energy] presenting for DUKE ENERGY
CAROLINAS, LLC, AND DUKE ENERGY PROGRESS, LLC

JENNY R. PITTMAN, ESQUIRE, representing the
SOUTH CAROLINA OFFICE OF REGULATORY STAFF

PUBLIC SERVICE COMMISSION OF SOUTH CAROLINA

101 EXECUTIVE CENTER DRIVE

 - PowerPoint Presentation Slides (PDF)

P R O C E E D I N G S

CHAIRMAN RANDALL: Please be seated. I want to welcome everyone to this allowable ex parte, and we'll ask Mr. Melchers to read the docket, please.

MR. MELCHERS: Thank you, Mr. Chairman.

Commissioners, we're here pursuant to a Notice of Request for Allowable Ex Parte Communication Briefing. The parties requesting the briefing are Duke Energy Carolinas, LLC, and Duke Energy Progress, LLC. It is scheduled for today, July 23rd, at 10 a.m., here in the Commission hearing room. And the subject matter to be discussed today is: Managing Duke Energy Hydroelectric Projects.

Thank you, Mr. Chairman.

CHAIRMAN RANDALL: Thank you.

Ms. Pittman, I think you're next, to give us the ground rules from ORS.

MS. PITTMAN: Thank you, Mr. Chairman.

Good morning. My name is Jenny Pittman and I'm a staff attorney with the Office of Regulatory Staff, and I am here today as the designee of the Executive Director of the ORS at this allowable ex parte.

As the ORS representative, it is my duty to certify the record of this proceeding to the Chief

7/23/18

1 Clerk of the Public Service Commission within the
2 next 72 hours and verify that this briefing was
3 conducted in compliance with the provisions of S.C.
4 Code Section 58-3-260(C).

5 The requirements of that statute are, in part,
6 that the allowable ex parte be confined to the
7 subject matter which has been noticed; and in this
8 proceeding, the issue noticed was "Managing Duke
9 Energy Hydroelectric Projects." I, therefore, ask
10 that the Commissioners, presenters, and Staff all
11 please refrain from discussing any matters not
12 related to this specific topic.

13 Secondly, the statute prohibits any
14 participant, Commissioners, or Commission Staff
15 from requesting or giving any commitment,
16 predetermination, or prediction, regarding any
17 action by any Commissioner as to any ultimate or
18 penultimate issue which either is or is likely to
19 come before the Commission.

20 Third, I would ask that the participants,
21 Commissioners, and Staff refrain from referencing
22 any report, article, statute, document of any kind
23 that are not included in today's presentation. A
24 copy of any document which is referenced during the
25 briefing today must be provided to me for inclusion

7/23/18

1 in the record which I will certify to Ms. Boyd.

2 And, last, everyone in attendance today must
3 read, sign, and return the form which you were
4 given at the door when you came in. This form must
5 be signed by each attendee to certify that
6 requirements contained in Section 58-3-260(C) have
7 been complied with at the presentation.

8 I appreciate all your time and attention.
9 Thank you, Mr. Chairman.

10 **CHAIRMAN RANDALL:** Thank you, Ms. Pittman.

11 Okay. Now, I think, Ms. Heather Shirley
12 Smith, who is representing Duke Energy?

13 **MS. SMITH:** Good morning. We'd like to thank
14 the Commission for your time this morning. And I
15 want to note that we have three presenters here for
16 you. We have Kodwo Gharthey-Tagoe, who is our
17 president of South Carolina; we have Jeff
18 Lineberger, who's our Director of Water Strategy
19 and Hydro Licensing; and Randy Herrin, who's our
20 Vice President of Carolinas Regulated Renewables.

21 We appreciate the Commission allowing us to
22 put on a three-person panel. We commit that our
23 presenters will not speak over one another; they
24 will speak one at a time, so that the court
25 reporter can capture everything that's said. And,

7/23/18

1 with that, I believe we're ready to begin.

2 [Reference: Presentation Slide 1]

3 **CHAIRMAN RANDALL:** Thank you.

4 **MR. KODWO GHARTEY-TAGOE [DUKE]:** Good morning,
5 Mr. Chairman, members of the Commission. I am
6 Kodwo Gharthey-Tagoe, president of Duke Energy in
7 South Carolina. It is my pleasure to appear before
8 you to talk about a subject that is important to
9 this Commission, our customers, Duke Energy, and
10 the great State of South Carolina.

11 Today, we'll look forward to discussing with
12 you how Duke Energy Progress and Duke Energy
13 Carolinas manage river systems with hydro
14 resources. Looking at both Carolinas, Duke Energy
15 currently manages 32 – and I need to flip this. As
16 you can see, I don't have much practice
17 [indicating].

18 [Reference: Presentation Slides 2-3]

19 Today we look forward to discussing with you
20 how Duke Energy Progress and Duke Energy Carolinas
21 manage river systems with hydropower resources.
22 Duke Energy currently manages 32 hydropower
23 reservoirs along nine river basins. Of those 32
24 reservoirs, 28 are Duke Energy Carolinas' assets
25 and four are Duke Energy Progress' assets. Ten of

7/23/18

1 those Duke Energy Carolinas' lakes are all or
2 partially located in South Carolina. Although we
3 manage these lakes and river systems, we are
4 licensed and regulated by the Federal Energy
5 Regulatory Commission, or FERC.

6 Our company was built on hydropower. Duke
7 Energy's history began with the Catawba Power
8 Company in the early 1900s. Dr. W. Gill Wylie,
9 James Buchanan Duke, and William States Lee founded
10 the company because they believed the South's heavy
11 dependence on agriculture was prohibiting growth of
12 other industries. So they envisioned an integrated
13 electric system of hydropower generating stations.
14 They took the first big step toward this goal in
15 1904, when the Catawba Hydro Station in South
16 Carolina began providing electricity to Victoria
17 Cotton Mills in Rock Hill.

18 Over the next several years, the company's
19 hydroelectric fleet continued to grow to serve not
20 only commercial textile mills but the entire
21 region's growing appetite for electricity. Public
22 safety gained increased focus after the Great Flood
23 of 1916. Back-to-back hurricanes triggered massive
24 flooding on the Catawba, Yadkin, and French Broad
25 Rivers, causing loss of life and property. At Duke

1 Energy, high-water management now became one of our
2 priorities as we rebuilt some dams and continued to
3 build new ones to provide additional hydropower.

4 We continued to grow and now have numerous
5 forms of electricity generation, but there is
6 something special about the systems of rivers and
7 lakes that the company manages. Not only do they
8 provide hydroelectric power but they also provide
9 condenser cooling water for nuclear and fossil
10 stations; they provide process water for industries
11 and drinking water and recreation opportunities for
12 millions. These river systems enhance the quality
13 of life for those who live on or use them, and we
14 are proud to be the company that created and
15 manages these reservoirs.

16 We understand the great responsibility we have
17 to our customers and others who are dependent upon
18 the lakes and rivers. Our lake neighbors and users
19 want to know we are effectively managing the river
20 system, not only on a day-to-day basis but during
21 extreme weather conditions, whether from drought or
22 high water from storms. They also want to know
23 that we are communicating effectively with them
24 throughout an event, as their safety is our main
25 priority.

7/23/18

1 Let me take a few moments and talk about
2 droughts. Duke Energy shares a commitment to
3 ensuring an abundant water supply is available to
4 communities along the rivers. Conserving water is
5 a shared responsibility among all water users,
6 including individual households, particularly
7 during drought conditions. Large water users and
8 resource agencies worked with Duke Energy Carolinas
9 to form the Catawba-Wateree and the Keowee-Toxaway
10 Drought Management Advisory Groups, and with Duke
11 Energy Progress to form the Yadkin-Pee Dee Drought
12 Management Advisory Group. These groups implement
13 drought protocols to reduce water use during
14 periods of low inflow in their respective basins.
15 These groups have agreed on the requirements set
16 forth in their drought protocols and will
17 reevaluate and modify them periodically.

18 Another priority for us is managing storm
19 events resulting in high water on our lakes. Part
20 of managing the river system is monitoring:
21 monitoring lake levels and the weather. Once we
22 determine a possible high-water event might occur,
23 we activate our Duke Energy team, consisting of our
24 hydro experts, meteorologists, corporate
25 communications, and our community relations leader,

7/23/18

1 a leader who is on my team and reports directly to
2 me. The team usually meets twice a day, every day,
3 until the event is over. And as conditions can and
4 often do change, they have to stay flexible in
5 these meetings.

6 Once the team determines the strategy to
7 manage the event – and you’ll hear more on strategy
8 later – we communicate externally to the public and
9 local emergency management. Communication takes
10 many forms during an event. Our Regulated
11 Renewables Operations Center, our hub in Charlotte,
12 which monitors and controls most of our operations
13 at our dams, is in contact with county 911 centers.
14 My community relations managers have the
15 responsibility of ensuring local government and
16 county emergency management officials are aware of
17 the situation and our management strategy. I can’t
18 say enough about our appreciation for the great
19 partnership we have with local emergency management
20 officials and their role in monitoring public
21 safety and taking protective action. We know how
22 much they rely on the information we share, and we
23 make sure they have access to us 24/7.

24 One of our primary goals is to drive those who
25 might be affected by a weather event to our

7/23/18

1 website. There they can see lake levels, read our
2 updates, which include a prediction on how high we
3 believe their lake will go, and a safety message.
4 We also offer an 800 number for the public to call,
5 and several organized groups of our lake neighbors
6 have our teams' e-mail addresses and phone numbers,
7 so they can reach out directly to us.

8 We are transparent, we understand their
9 concerns, and I believe our team does its best to
10 manage these events. We know lake neighbors are
11 concerned about their backyard – and I would be,
12 too, if I lived on a lake. We try our best to help
13 them also understand that we have to manage an
14 entire river system, not just one lake. These
15 hydropower reservoirs have been around a long time
16 and their value to our company and the communities
17 we serve continues to increase. I'd like to
18 particularly thank the managers of the many public
19 water systems and the local emergency management
20 directors for their ongoing partnerships to help
21 everyone to use these limited water resources
22 wisely and to protect the public as we manage
23 through challenging weather extremes.

24 Thank you again for allowing us the
25 opportunity to be with you today. Now, to help you

7/23/18

1 understand how we manage our river systems, I'll
2 turn it over to Jeff Lineberger to my right.

3 [Reference: Presentation Slides 4-5]

4 **MR. JEFF LINEBERGER [DUKE]:** I want to talk to
5 you today – thank you for having us here, Mr.
6 Chairman, and Commissioners. I'm going to talk to
7 you today a little bit about our regulatory
8 framework for our hydro projects, how we approach
9 relicensing of these hydro projects, and then a
10 little bit about one of the extremes that we have
11 to deal with and how we go about managing that.

12 There are a lot of ingredients or a lot of
13 things that go into a modern hydro-project license,
14 and you can see the list of them up there
15 [indicating]. Technical studies are certainly a
16 big part of the process. You have to, basically,
17 evaluate how your project is affecting the river
18 and how it's affecting the community and the people
19 that are there now, and the people that you might
20 expect to be there decades into the future. We
21 also have stakeholder agreements where we work with
22 lake neighbors and other folks to help shape that
23 future of what the license should look like. Water
24 quality is a big issue for reservoirs, in
25 particular, that stratify in the summer – hot water

7/23/18

1 on top, colder or lower-oxygen water in the bottom.
2 So water quality certifications are necessary from
3 each state that's involved, to make sure that how
4 you're proposing to operate will meet state water
5 quality standards. There can be endangered
6 species. There can also be this thing called fish
7 passage prescriptions. Basically, there's some
8 fish species that live in the ocean part of their
9 life and have to move to freshwater to complete
10 their lifecycle, or vice versa, and when you have
11 those kinds of fish species involved, you have to
12 figure out a way to pass them around your dams;
13 they can't do it by themselves.

14 FERC licenses are for a very long time – 30 to
15 50 years – so you really have to invest a lot in
16 the process. The relicensing process itself is at
17 least six years long, and it can take much longer
18 than that sometimes.

19 We have relicensed, now, in the Carolinas, all
20 of our hydro projects that have FERC licenses,
21 except one. The one that remains is the Bad Creek
22 Project; its license expires in 2027, so in the
23 next couple of years we'll actually be starting
24 that relicensing process, as well.

25 What we are here really to focus on today is

1 kind of the water-management piece of all this.
2 There's a lot in a modern FERC license, but what
3 you see on the board are really the things that
4 kind of dictate the management of the water.
5 There's a lake-level regime that is described in
6 that license that provides bounds on us as to how
7 high or low we can operate those lakes, and then
8 you may have aquatic flow releases that are
9 required for fish habitat downstream, recreation
10 flow releases so that the community can use the
11 river the way that they need to, recreation
12 facilities to provide safe access is certainly a
13 part of that license. And then you have to deal
14 with the more extreme conditions: droughts, which
15 it seems like we've been in a lot. And I'll talk a
16 little more about that later. You need to have a
17 basic expectation about how you operate when
18 there's not enough water to go around. And then
19 you have emergency conditions; either equipment
20 will fail or you'll have weather extremes or other
21 public safety situations that require some special
22 protocols. So those are defined in the licenses.

23 [Reference: Presentation Slide 6]

24 This slide talks about Duke Energy's approach
25 to relicensing. Hydro relicensing is a really big

1 deal for a hydro company. It happens once every
2 generation. And what you're trying to do at that
3 point is look forward to the next 30 to 50 years
4 and determine what's going to be the best overall
5 development for that waterway. In other words, how
6 can you change that river as you go out into the
7 future to make it better meet the needs.

8 You see a quote down at the bottom from Helen
9 Keller. If you could wrap up our approach to
10 relicensing, it is exactly that quote. And, in
11 fact, we used that quote as the centerpiece for how
12 we would set up our stakeholder teams in each river
13 basin where we have multiple projects. You know,
14 lots of – everybody has their own idea about how
15 the project needs to be operated. And rather than
16 argue over that and fight about whose use was more
17 important, we kind of established the precedent
18 that they were all important, so let's get all
19 those folks at the table, figure out what is within
20 the art of the possible, and let's figure out a way
21 to get there. We did that by establishing
22 stakeholder teams. And the picture you see there
23 is actually our Keowee-Toxaway Relicensing
24 Stakeholder Team. And we had all the various users
25 represented: lake neighbors, downstream recreation

7/23/18

1 uses, on-lake recreation uses, municipal water
2 systems, industry, and state and federal resource
3 agencies obviously have a heavy role in
4 relicensing.

5 For our collective hydro projects over about
6 the last 15 years, we've had 250 stakeholders,
7 plus, involved. That doesn't include, necessarily,
8 all the staff from the resource agencies that were
9 involved. Hundreds of public workshops. Most of
10 those public workshops went all day. And our
11 stakeholder teams were all independently
12 facilitated by a professional facilitator who would
13 try to drive the process not to meet Duke Energy's
14 needs but to meet the collective needs of the
15 people that were represented there. In many
16 respects, the stakeholder processes we ran were
17 absolutely public planning processes, to plan a
18 shared resources for the future.

19 Sound science and engineering had to be a key
20 component, because anything you're going to ask the
21 Federal Energy Regulatory Commission to approve,
22 they have to know that it is based on that sound
23 science and it's not just what people want. All
24 the stakeholders were involved, all were able to
25 negotiate towards these relicensing agreements.

7/23/18

1 Most of them actually signed the agreements. In
2 some cases, folks felt like they could go straight
3 to FERC and get an outcome that was better for
4 their interests, and that was certainly fine. But,
5 in the end, what we wound up with in most cases was
6 a stakeholder agreement that we designed our
7 license application around, so that when FERC got
8 it, they were basically hearing from the region
9 that this is how the region wants FERC to issue the
10 new license and require a little different
11 operation than maybe we had in the past.

12 [Reference: Presentation Slide 7]

13 Okay. Reservoirs are a big part of our hydro
14 operation. In fact, we could not operate without
15 them. In the last 19 years, going back to 1999, 15
16 of those 19 years we have had below-average
17 rainfall, below long-term average rainfall, in the
18 Duke service areas in the Carolinas. So most of
19 the time, over about the last two decades, we've
20 been in a drought. And some of those droughts have
21 been significant. In fact, two of them were the
22 new droughts of record. We had a four-year drought
23 from '98 through 2002; that was the new drought of
24 record at that time. And then we had another one
25 from '07 into early '09 that broke that one. And

7/23/18

1 you guys, you folks, know what happens when there's
2 not enough rainfall to support all the needs. What
3 happens is what you see there at Lake Jocassee.
4 It's down 26 feet when that particular picture was
5 taken. But these hydro reservoirs are a shock
6 absorber; they help us work through periods when
7 there's not enough rain to meet all the needs.

8 A big part of our relicensing process was to
9 design a regional protocol that would basically
10 operate on the principle that all parties that are
11 using water, when you hit these various stages of
12 droughts, will all cut back, will cut back in a
13 known, planned sequence, so that we slow down the
14 rate at which we're consuming water from the
15 reservoirs. You can't conserve your way out of a
16 drought; eventually, it has to start raining again
17 to fill the lakes up. But what you can do is slow
18 down your human uses, so you buy more time for that
19 rainfall to come, and that's really what those
20 drought protocols do. We've got public water
21 utilities, industries, resource agencies, and Duke
22 all involved there. We communicate very
23 frequently, very often, and we follow what each
24 other is doing to make sure everybody is doing
25 their part. It's all about shared responsibility.

7/23/18

1 There's a lot of information on the Duke
2 Energy website that covers our drought protocols in
3 the river basins and it is really very helpful.
4 From some of our post-event evaluations, the single
5 most important thing that has happened in these
6 river basins is the slow-inflow protocol. That's
7 how we kept all the water intakes, for instance, in
8 the Catawba Basin, covered in that new-record
9 drought from '07 to early '09. It was early
10 detection, early action, and coordinated action by
11 all the key parties.

12 In a very significant way, with these new
13 licenses, we now have a safety net there in that
14 shared water supply that never existed before. So
15 there are some good things that come from new
16 regulation, and particularly when you can evaluate
17 a shared resource together and everybody recognizes
18 the need to do their part.

19 I'm going to turn it over to Randy Herrin now,
20 and he's going to tell you about some more aspects
21 of hydro operation.

22 **MR. RANDY HERRIN [DUKE]:** Good morning. I'm
23 Randy Herrin; I'm the vice president of Carolina
24 Regulated Renewables. We're responsible for the
25 operation, maintenance, of the hydro facilities

1 that Duke Energy owns. We're also responsible for
2 the FERC Owners Dam Safety Program.

3 [Reference: Presentation Slides 8-9]

4 I want to thank the Commission for the
5 opportunity to present, this morning. As Kodwo
6 mentioned, Duke Energy has a long history in clean
7 hydro renewable power dating back to 1904 in the
8 Duke Energy Carolinas company and also over 100
9 years of service in the Duke Energy Progress
10 company.

11 Last year, 2017, we generated over 5.2 million
12 megawatt-hours of gross generation from these
13 facilities. There are a total of 33 facilities in
14 both North and South Carolina, including DEC and
15 DEP. They provide a tremendous benefit to our
16 customers, providing flexible dispatch to support
17 energy demand, when needed, and we operate these
18 facilities from a central operating center in
19 Charlotte, North Carolina.

20 [Reference: Presentation Slide 10]

21 Another important aspect of these facilities
22 is the storage benefit that we get from them. We
23 have two pumped storage facilities. I'm sure some
24 of the Commissioners have heard of the pumped
25 storage stations Bad Creek and Jocassee that are

1 both in South Carolina. They generate to meet peak
2 energy demand; and during off-peak times, such as
3 nights, weekends, or other off-peak hours, we would
4 reverse the units and pump the water back up into
5 the upper reservoirs to store the energy for future
6 need, for customer demand. They provide tremendous
7 grid support on a daily basis. One other important
8 aspect is we have – between the two sites, we have
9 over 2000 megawatts of both generation and pumping
10 capacity, which I want to mention is still a
11 tremendous benefit to our grid.

12 These facilities help integrate other
13 renewables, such as solar, on a daily basis and
14 help offset load from our generation from our coal
15 stations, nuclear, and our gas stations.

16 Currently, we have in the plans to add 335
17 megawatts to our Bad Creek Pumped Storage Station.
18 That project is now underway. We just completed a
19 station outage this summer where we dewatered the
20 reservoir to install the new main step-up
21 transformers for the site and also do maintenance
22 on the spherical valves, which are the main shut-
23 off inlet valves for the site. We currently have
24 plans to start the first unit outage in 2019, and
25 the last unit outage will complete in 2023. And at

7/23/18

1 that time we'll have an additional 335 megawatts at
2 Bad Creek.

3 [Reference: Presentation Slide 11]

4 So one of the, obviously, primary reasons for
5 being here was to talk about how we manage our
6 river operations, especially during high-water
7 times. And just one thing to keep in mind is,
8 every storm is different; no storm is ever the
9 same. We use a lot of tools to help us predict
10 what we need to do. We look at the seven-day
11 forecast, we look at current forecasts, we look at
12 current lake levels, we're also looking at stream
13 inflows.

14 With all this information, we have to make
15 decisions on how to generate an integrated chain of
16 reservoirs. Based on that, we determine how to run
17 the units, how much flow to pass in preparation for
18 the storms. And then, as the storms materialize,
19 we will adjust as needed. Obviously, our primary
20 goal is to store as much of the water as possible
21 and to systematically release it, as it
22 materializes. You know, we do that with the goal
23 in mind of minimizing risk to our customers, to our
24 lake neighbors, to public recreation, so,
25 certainly, the safety of all involved is of utmost

7/23/18

1 concern. And as Kodwo mentioned, we have many
2 means of communicating as we materialize through
3 these storms.

4 To your right on the screen, you'll notice
5 there's a picture of – that was actually Tropical
6 Storm Alberto, in the upper right corner. I would
7 point but the pointer didn't work when we tried it.
8 So that's another tool we use; we're looking at the
9 National Weather Service tropical storm
10 forecasting. That gives us good indications a week
11 out, a lot of times, as to what could be impacting
12 us, and we have to start adjusting as necessary.

13 One thing that's important to know is how we
14 reference the dams. So on your left at the bottom
15 of the screen, that is a facility that has what's
16 called floodgates or spillway gates, and the one on
17 the right is what we call an open spillway. The
18 open spillway is the design of Lake Wateree Dam.

19 For our lakes, as I mentioned, in our
20 operating center we're controlling 32 facilities
21 and it's important to have a quick reference to
22 what the water levels are, so we reference all of
23 our lake elevation to full pond, which would be the
24 top of the dam on the right or the top of the
25 floodgates on the left, and we correlate that to

7/23/18

100.0, which is full pond.

[Reference: Presentation Slide 12]

I now want to talk a little bit about the differences of those two designs. The first is the ungated or open spillway concept, like Lake Wateree. The way that dam is designed to work is, essentially, all water that is flowing to it would pass through the units, so the units would generate based on the water that's available. During high-flow events, when you get a major storm and you can't pass the water – any more water through the units, then the water level will start to rise in that lake, to the point that it spills or goes above full pond, or 100.0. And then, also, that level can continue to rise beyond that point, just depending on how much inflow is coming in. It's considered a passive spillway. It's a very good design from that standpoint: no moving parts, no equipment to fail. It's a very safe means of passing water. Unfortunately, though, the water does rise; that's the way it's designed to work. So in the case of Lake Wateree, that dam, the water level, once it reaches full pond, if the flows continue it would spill over and the water level would continue to rise, depending on how much

7/23/18

1 inflow.

2 In the picture at the bottom left, that is
3 actually Wateree Station, and it's during a high-
4 flow event.

5 [Reference: Presentation Slide 13]

6 So, a gated facility works a little different
7 from the standpoint we're basically managing the
8 storage to the maximum that we can. We manage that
9 water up to the top of the spillway gates, which is
10 what we consider full pond. The difference is we
11 do not allow the water to spill over the top of
12 those gates. Basically, it creates safety issues;
13 it can create issues with the gates' functionality.
14 Debris would start to go over and could jam the
15 mechanisms that work the gates. The most important
16 feature of the floodgate is the protection of the
17 dam. We're responsible for ensuring the integrity
18 of the dam, and so we have to make sure the
19 floodgates are operational. So we would operate
20 those floodgates to handle any additional flow that
21 would come into that reservoir.

22 So, if you are looking at different reservoirs
23 on our website during a storm, you may see, you
24 know, a Lake Wateree that reads 101.0, which means
25 it's spilling one foot, or you may see Lake Norman

7/23/18

1 sitting at 100.0. Lake Norman is a gated spillway;
2 Lake Wateree is an ungated spillway. So that's why
3 you would see differences when you look at our
4 website.

5 [Reference: Presentation Slide 14]

6 So now I want to talk just a second about the
7 most recent storm, subtropical storm, Alberto, that
8 came through our service territory. The USGS chart
9 on the right illustrates that we received roughly
10 nine inches of rain over a sixty- – six-day period.
11 The gauge that we're looking at, Pleasant Gardens,
12 North Carolina, is just outside Marion, North
13 Carolina, which is Lake James, our uppermost
14 reservoir on the Catawba-Wateree. That storm
15 system actually followed two other significant
16 storms that we had prior to it, in April and May,
17 which basically already had lake levels somewhat
18 elevated, and we were also getting a significant
19 amount of inflow from the streams. Just for
20 reference, in April, our basin average was 141
21 percent of average rainfall, and for May it was 148
22 percent, so both April and May had already received
23 significant inflow.

24 [Reference: Presentation Slide 15]

25 Diving a little deeper into the actual storm,

1 over the five-week period that we're referencing
2 below in this chart, we had three storms. The
3 first storm occurred in/around April, late April,
4 April 22nd timeframe. That was about a five-inch
5 storm of rainfall. The blue line is Lake James,
6 the red line is Lake Norman, and the green line is
7 Lake Wateree. In and around May 20th, we received
8 another storm system that came through, received
9 about six inches of rain at that same location,
10 Pleasant Gardens. And you can see, in the case of
11 Lake James, it did go over full pond during that
12 event. And then the final event, which occurred
13 in/around late May, that is the Alberto storm
14 system that we have circled. Lake James, the blue
15 line, you can see how high the level went; it went
16 up close to four feet above full pond, not quite
17 four feet. That was the nine-inch rainstorm that
18 we had. And in that case, Lake Wateree did spill,
19 or go above full pond; it went slightly over one
20 foot above full pond.

21 Also, one thing to note on this chart, it took
22 about seven days for that water to move through the
23 system, so the rain that comes in on the upper part
24 of our system, it ultimately has to go through the
25 last reservoir, which in this case is Lake Wateree.

7/23/18

1 So after a high-water event, we basically work
2 – sorry.

3 [Reference: Presentation Slide 16]

4 There we go. Thank you. After the high-water
5 event, what we do is work to get the reservoirs
6 back to target. So, our FERC license gives us a
7 target elevation that is the general guideline for
8 where the reservoir should be, based on a certain
9 part of the year. You can get that from our
10 website, as well, when you go check lake levels.
11 So we essentially work to move the water through
12 the systems, through floodgates, until the water
13 levels recede, or they will continue to spill over
14 the spillways, as well, until the water levels
15 recede, because, you know, just because a storm
16 passes through, the inflows will continue from the
17 streams and reaches for days. So it takes, you
18 know, a – it can take a week, easily, to move the
19 water through the system.

20 And as I mentioned, also, Lake Wateree, which
21 is our last facility in the Catawba-Wateree chain,
22 in those ten reservoirs it can take days for it to
23 get back to normal elevation or to our target
24 elevation.

25 [Reference: Presentation Slide 17]

1 So how have we done on Lake Wateree? So, if
2 you look at the past 15 months of operation, you'll
3 see that there were two other times – on your left,
4 on the chart, you'll notice that around the end of
5 April, the first of June, in 2017, there were two
6 excursions where the lake went above full pond.
7 And then, most recently, in June of this year,
8 during Alberto, where Lake Wateree went to one foot
9 above full pond.

10 We are, as a part of the comprehensive
11 licensing agreement with the FERC for the Catawba-
12 Wateree, we are adding additional spillway capacity
13 to Wateree Dam of 10,000 cfs, which equates to
14 about 400 Olympic-size swimming pools per hour of
15 flow. So that's how much water we're talking about
16 that we are adding the ability to move. What that
17 will do is it will help manage the water level on
18 Lake Wateree during some of these high-flow events.
19 It will not prevent Lake Wateree from going above
20 full pond, but it will help minimize some of these
21 smaller excursions, such as the one-foot-over-full-
22 pond excursions.

23 [Reference: Presentation Slide 18]

24 So, now, just to touch on a couple – we get a
25 lot of questions, needless to say, from lake owners

1 up and down the reservoirs, North and South
2 Carolina. So I just wanted to talk – and I’ve
3 tried to touch on things to kind of illustrate a
4 lot of this. It’s a very complex – it’s very
5 complex to operate the river systems. It’s not an
6 exact science, but we use all the most exact tools
7 that we have. When you look at – one myth is: DEC
8 manages flooding events differently on North
9 Carolina lakes than South Carolina. And that is –
10 the truth of it is we manage them the same, but
11 there are differences between dams. As I
12 mentioned, some are gated, some are ungated
13 spillways, that can result in water levels that
14 appear different. You know, you may have one
15 reservoir above full pond and one not. You’ve got
16 – it depends on how much rainfall you get in any
17 certain area. You know, just because you get nine
18 inches of rain at Lake James, you may have only got
19 a half an inch at Lake Wateree and it appears like,
20 well, we really didn’t get any rain, but, in fact,
21 we got a lot of rain.

22 Another myth is: The lakes were designed for
23 flood control, but DEC doesn’t operate them that
24 way. So our lakes do have some flood-control
25 ability. We have targets that are established by

7/23/18

1 the FERC, and we operate to those targets and it
2 provides a modest amount of storage to handle high-
3 inflow events. It's not of the same caliber as,
4 say, a Lake Hartwell, which the Corps of Engineers
5 operates, which they operate at a much lower level.
6 Our reservoirs are operated to serve many things,
7 as Jeff mentioned in his presentation, such as
8 water use for drinking water, recreation, lake
9 neighbors. There's many uses. And so we manage
10 that to a target that equates for all of that.

11 The last one is: DEC waits too long to begin
12 drawing down reservoirs when storms are
13 approaching. I hope I've tried to illustrate the
14 complex nature of trying to manage to these
15 different storms. And just to kind of illustrate
16 that, I want to flip back to this previous slide.

17 [Reference: Presentation Slide 17]

18 If you'll look at the date around September,
19 mid-September of 2017, if you see the – it's kind
20 of in the middle of the chart. That is actually
21 Hurricane Irma that was coming up through the Gulf
22 and, initially, it was projected to come straight
23 through our service territory, right up the
24 Catawba-Wateree, so we began immediate draw-down
25 actions on Lake Wateree. So this Lake Wateree

7/23/18

1 level, we pulled it down from 98 to 95½ feet – I'm
2 sorry – 95.5. And in that case, the storm kept
3 drifting left, or west, and ultimately we really
4 got very little rain. I think we got about an inch
5 of rain in the Upper Catawba Basin. So in that
6 case, you know, that just shows the nature of
7 trying to predict. I think everybody on the
8 Commission probably understands how difficult it is
9 to predict the weather.

10 And with that, I will turn it back over to
11 Jeff Lineberger.

12 [Reference: Presentation Slides 19-20]

13 **MR. JEFF LINEBERGER [DUKE]:** All right. As
14 Kodwo mentioned, these lakes have been around a
15 long time, over 100 years. And our companies and,
16 really, our economy and our communities have all
17 grown up around them and grown dependent on them.
18 And we hope another 100 years will go by, and the
19 region is still relying on those outstanding
20 resources.

21 One of the things that a stakeholder process
22 and relicensing does is it lets you have a regional
23 learning opportunity. And one of the things the
24 region learned in the Catawba was that, even though
25 there's a lot of usable storage in those 11 lakes

1 there, there can be times when it's not enough, and
2 in particular, if the region continued to grow the
3 way it was projected to grow when we were
4 relicensing, at some time around the middle of this
5 century, around 2050, the capacity of those lakes
6 to support additional growth would be reached,
7 which meant, in other words, not that water intakes
8 would go dry but you would get to the point where
9 you could not add significant new economic
10 development in the Catawba Basin. Stop and think
11 about that just for a minute. And that was arrived
12 at using the most sound science and engineering,
13 but you're having to do projections out 50 years,
14 which is a long time. But it really kind of shook
15 us all.

16 And we decided – and when I say “we,” I mean,
17 primarily, Duke Energy and 18 public water
18 utilities that rely on the Catawba Lake System – we
19 decided that we needed to do something about that,
20 because that wasn't an acceptable alternative. And
21 the something we decided to do was this Catawba-
22 Wateree Water Management Group. We established a
23 501(c)(3) nonprofit in 2007 of Duke Energy
24 Carolinas and the 18 water utilities that either
25 had an intake in one of those 11 reservoirs or it

7/23/18

1 was in the river right downstream, so they relied
2 on the storage in the reservoirs. We all agreed to
3 pay dues, and the dues were based on, relatively,
4 how much of that water resource you were, as an
5 entity, using. In total, we collect \$550,000 a
6 year from the 19 members, and then we turn that
7 money into collective investment into that shared
8 resource. We have a five-year rolling projects
9 list where we are trying to accomplish things that
10 will basically let the river help us to continue to
11 grow for further out into the future, while at the
12 same time protecting the environment.

13 We've accomplished a lot with that money.
14 We've invested over \$5 million since 2007. We've
15 completed – I think we're up to 26 technical
16 projects now that we've completed. And to give you
17 some examples there of what those do, they're
18 getting at things like better use of technology and
19 better information being provided to customers so
20 that they can use water and energy more
21 efficiently.

22 Water intake contingency plans. You know, a
23 few of those 18 water utilities had contingency
24 plans that thought about, "Well, what happens if my
25 intake fails, for whatever reason? What will I do

7/23/18

1 then to meet my public safety and health
2 requirements to provide water to the citizens?”
3 Several of them did not. So one of the projects
4 that the group tackled was, “Let’s make sure all
5 those water utilities have a good contingency plan,
6 in case that really bad day happens and you can’t
7 use your water intake that’s in one of these Duke
8 Energy reservoirs.”

9 Looking at reducing water loss from those same
10 water utilities, from their distribution systems –
11 again, another way so that humans are using water
12 more efficiently – I did some evaluations and
13 projections for how fast we’re losing storage in
14 the lake system from sedimentation and to better
15 understand the interaction between groundwater and
16 surface water in those lakes. Sometimes when we
17 hit these droughts that last for months and months
18 and months, instead of the groundwater supplying
19 the lakes with water, you actually have a reversal
20 there where the lake starts supplying groundwater,
21 so that makes lake levels drop faster than can
22 otherwise be explained. So that’s one of those
23 unusual things that happens in extremes.

24 And we’re continuing to try to get better on
25 our water-demand forecasting going out into the

7/23/18

1 future. The most significant thing, though, and it
2 actually rolled up a lot of those 20-some projects,
3 was this Water Supply Master Plan. I told you that
4 mid-century for reaching the economic growth
5 capability of the resource wasn't acceptable. We
6 knew we wanted to push it out further, we wanted to
7 push it out as far as could reasonably be expected.
8 And the end result of about two and a half years of
9 work, there, was to do essentially an integrated
10 resources plan for the shared water resource in the
11 basin that spanned the water and the electric
12 utility industries. We were able to accomplish
13 that, and we developed a Water Supply Master Plan
14 that has a defined set of actions, some of which
15 Duke Energy will take, some of which the water
16 utilities will take. But the current projection is
17 that, if we all implement our requirements under
18 that plan, that we will at least be able to
19 continue to grow through the year 2100. And we're
20 going to update that plan at least every ten years.
21 The next update would be due in 2025. I expect
22 we'll update it sooner than that, to account for
23 some of the things that have changed already since
24 we came out with that plan. This plan is not a
25 shelf document; it's a living, breathing process

7/23/18

1 now, and we talk about it all the time. That group
2 meets – the entire group meets every other month,
3 and the board meets the months in between. So it's
4 as active and as effective an organization as I've
5 ever been a part of. It's really been – it's been
6 a pleasure to be involved with these folks, because
7 we all understand that we can't make it if the
8 river can't make it, so what we're doing is to help
9 the river help us use it longer.

10 [Reference: Presentation Slide 21]

11 And, with that, again, we very much appreciate
12 the opportunity to talk about where our company
13 came from – we started as a hydro company, and it's
14 still profoundly important to us, and we understand
15 how important it is to the region.

16 If you have questions, we'll be glad to
17 entertain them.

18 **CHAIRMAN RANDALL:** Thank you.

19 Commissioners, any questions?

20 **COMMISSIONER ELAM:** Mr. Chairman.

21 **CHAIRMAN RANDALL:** Commissioner Elam.

22 **COMMISSIONER ELAM:** Good morning. I guess,
23 Mr. Herrin. You said in your presentation you were
24 going to add 335 megawatts to Bad Creek. How do
25 you do that?

1 **MR. RANDY HERRIN [DUKE]:** It's pretty
2 complicated.

3 [Laughter]

4 **COMMISSIONER ELAM:** Well, I didn't think you
5 could really expand the powerhouse.

6 **MR. RANDY HERRIN [DUKE]:** You're right. We
7 are adding – replacing the turbines, so the part
8 that turns when the water passes through, so we're
9 putting in higher-output, more efficient turbines.

10 Also, we're rewinding the generators, so we're
11 upgrading the generators. I mentioned that we had
12 just completed a station outage to replace the main
13 step-up transformers; we had to do that, as well,
14 because of the additional output.

15 And then there are some other systems inside
16 the plant, also, that were upgraded. But,
17 essentially, it's through a more modern turbine
18 design, more or less, turbine efficiency
19 improvement.

20 **COMMISSIONER ELAM:** Okay. On one of your
21 slides – I guess I'm on page 17 – you were talking
22 about the lake levels and you said at one point you
23 had drawn the lake down at 95.5.

24 **MR. RANDY HERRIN [DUKE]:** Uh-huh.

25 [Reference: Presentation Slide 17]

1 **COMMISSIONER ELAM:** Did that create any
2 problems as far as shortages, at that level?

3 **MR. RANDY HERRIN [DUKE]:** You know, whenever
4 we were watching Tropical Storm Irma, and we had to
5 make some decisions around lake levels, the
6 predictions we were seeing at the time were
7 somewhere around eight to ten inches of rainfall,
8 and so we knew we needed to make some room, so we
9 started to aggressively pull the reservoirs down.
10 In that case, as I mentioned, we got – I think it
11 was, on average, less than an inch of rain in the
12 Upper Catawba, but that was enough rainfall, along
13 with the stream flows at that particular time, we
14 were able to recover and get back to target pretty
15 nicely. So in this particular case, we were able
16 to get back to target, and that's the balance we
17 have to work with, because we don't want to put us
18 into a drought situation by pulling the reservoirs
19 down preemptively and thus losing that water and
20 not – and then when you don't get it, you can't get
21 it back. So we have to really balance that.

22 **COMMISSIONER ELAM:** So what's sort of the
23 breaking point of a shortage or drought problem, as
24 far as how far down you can go?

25 **MR. RANDY HERRIN [DUKE]:** So we do have

7/23/18

1 minimum operating ranges on the reservoirs that are
2 established by the FERC. Those are also on our
3 websites; you can go in and look at what is deemed
4 the operating range. Typically, we would try to
5 stay within that range, but during, you know,
6 severe conditions, we can deviate from that.

7 **COMMISSIONER ELAM:** Okay. Mr. Lineberger, on
8 page seven, on your drought page, you have a bullet
9 point at the bottom referred to as "safety net."

10 [Reference: Presentation Slide 7]

11 **MR. JEFF LINEBERGER [DUKE]:** Right.

12 **COMMISSIONER ELAM:** And could you kind of go
13 through and explain the safety net, what that is
14 and what are the parts of it?

15 **MR. JEFF LINEBERGER [DUKE]:** Yes, sir, I'll do
16 that. The safety net is the slow-inflow protocol,
17 itself. You know, if – we've got reservoir storage
18 there, and if we were just focused on the Duke
19 Energy hydro use of that reservoir storage, the
20 dryer it gets the faster we would use it – right? –
21 because we want to provide our electric customers
22 with – hydropower is the cheapest resource we have.
23 So, the dryer it gets the faster we'd use it, the
24 more we would use hydro. What the safety net does,
25 though, is it requires us to slow down. One of the

7/23/18

1 very first steps in the low-inflow protocol is for
2 Duke to basically stop using its discretionary
3 hydro generation. What we do is we meet the
4 downstream minimum release requirements, and above
5 that that's all we do, when we get into the later
6 stages of the low-inflow protocol.

7 So that volume of water stored in the
8 reservoirs is like a bank account, almost, for the
9 region, and rather than continuing to use it at a
10 rapid rate when the drought comes, the procedure
11 says to slow down. So you're able, then, to keep
12 some flow going downstream for a longer period of
13 time than you would have otherwise been able to.
14 And that's the safety net aspect. It'll keep water
15 intakes covered downstream longer in a drought, by
16 slowing down. It will also keep the aquatic
17 resources with a higher level of flow.

18 If you took away our low-inflow protocol and
19 you took away our reservoir storage, you know, the
20 '07-'09 drought, there would have been sections of
21 the Catawba River that would have been dry.

22 **COMMISSIONER ELAM:** In that bullet point, you
23 list public drinking water, industrial water,
24 aquatic communities, and power generation that
25 never existed before. I think I understand the

7/23/18

1 industrial water users – you’re talking about
2 manufacturing?

3 MR. JEFF LINEBERGER [DUKE]: Right.

4 COMMISSIONER ELAM: Is the industrial farming
5 part of that? Because I know that’s been an issue
6 that’s been kicking around in South Carolina
7 lately.

8 MR. JEFF LINEBERGER [DUKE]: Right.

9 COMMISSIONER ELAM: If you could discuss about
10 how that fits in.

11 MR. JEFF LINEBERGER [DUKE]: The agricultural
12 piece in the – for the main stem of the Catawba,
13 there are just not many large agricultural
14 irrigation water intakes in that section of river
15 anymore.

16 COMMISSIONER ELAM: Okay.

17 MR. JEFF LINEBERGER [DUKE]: But we do account
18 for agricultural demand in the total Catawba River
19 Basin when we do these long-range plans. But there
20 are not any large, what you would call, industrial-
21 scale irrigation water intakes in any of these 11
22 reservoirs for agricultural uses.

23 COMMISSIONER ELAM: And “aquatic communities,”
24 you’re talking about marinas?

25 MR. JEFF LINEBERGER [DUKE]: No, sir, I’m

7/23/18

1 talking about fish.

2 **COMMISSIONER ELAM:** Fish.

3 **MR. JEFF LINEBERGER [DUKE]:** I'm talking about
4 fish and aquatic life in the river, downstream from
5 the dams. They need water, obviously, all the
6 time.

7 **COMMISSIONER ELAM:** Okay. And "power
8 generation that never existed before"?

9 **MR. JEFF LINEBERGER [DUKE]:** Yes, and it's a
10 safety net for power generation. We also have
11 thermoelectric plants on these reservoirs. If you
12 look at the hydro stations, there are 13 of those
13 on the Catawba, and our four steam plants that are
14 on the Catawba, that represents about 25 percent of
15 our installed generating capacity for Duke Energy
16 Carolinas and Duke Energy Progress, in total, in
17 the Carolinas. So a fourth of the power we're
18 generating is relying on that water resource. And
19 if we were to run all that water out to support
20 hydro generation and had to curtail generation at
21 the larger steam plants, that wouldn't be good for
22 Duke Energy nor our customers. So when we are
23 providing slowing down the use of that storage, we
24 are benefiting power generation, as well.

25 **COMMISSIONER ELAM:** Thank you.

7/23/18

1 **MR. JEFF LINEBERGER [DUKE]:** Yes, sir.

2 **CHAIRMAN RANDALL:** Thank you.

3 Commissioner Whitfield.

4 **COMMISSIONER WHITFIELD:** Thank you, Mr.
5 Chairman.

6 I'd like to thank all three of you for your
7 presentations. Very informative. Mr. Herrin, Mr.
8 Lineberger, certainly for the technical end, the
9 hydrology part of it, climate and geology part of
10 it. We certainly appreciate all of that and all
11 that you're doing. And Mr. Gharthey-Tagoe, we
12 certainly appreciate your historical perspective of
13 how and when the system was created and for what
14 purpose.

15 But right now, I guess we're in the present
16 day, and I want to discuss present day, where we
17 are now and where we are, going forward. That said
18 – and I don't care which one of you answers this,
19 but just a couple of quick questions before I dive
20 into some specific ones. What's your percentage of
21 hydro, currently, in – I guess I'm going to say
22 DEC/South Carolina, or just percentage overall if
23 you have it, for hydro? We know it's very low, but
24 I would just – if you could answer that.

25 **MR. KODWO GHARTEY-TAGOE [DUKE]:** Between the

1 two utilities, it's 10 percent.

2 COMMISSIONER WHITFIELD: Oh, it's that high.

3 MR. KODWO GHARTEY-TAGOE [DUKE]: Ten percent.

4 COMMISSIONER WHITFIELD: DEC and DEP?

5 MR. KODWO GHARTEY-TAGOE [DUKE]: Correct.

6 COMMISSIONER WHITFIELD: For both Carolinas.

7 MR. KODWO GHARTEY-TAGOE [DUKE]: Correct.

8 COMMISSIONER WHITFIELD: Okay. That said, if
9 you could go to page three on your –

10 [Reference: Presentation Slide 3]

11 All of those river systems flow back through
12 South Carolina, even the ones that aren't in our
13 State, with the exception of the mountain area –
14 and I think we can agree on that's across the
15 Continental Divide. But I want to focus on the
16 ones that are in South Carolina, if you can answer
17 these questions – and I know you had some
18 discussion about the FERC license. Could you tell
19 us when each one of these were – the date they were
20 relicensed, and whether it's a 30-year license or
21 longer, from FERC?

22 MR. JEFF LINEBERGER [DUKE]: Commissioner,
23 I'll try to cover that. If you start over on the
24 left, the Bad Creek Project is still on its
25 original license. It was licensed in 1977. That

7/23/18

1 license is for 50 years; it expires in 2027. And
2 the relicensing process, the regulatory window is a
3 minimum of five and a half years long. So, at
4 least five and a half years before that license
5 expiration date, you have to be in the regulatory
6 process.

7 **COMMISSIONER WHITFIELD:** Certainly.

8 **MR. JEFF LINEBERGER [DUKE]:** So you really
9 need to be doing your planning and a lot of your
10 communication before that, but that's just a
11 general statement. Keowee-Toxaway, that has Lake
12 Keowee and Lake Jocassee in it; it was relicensed –
13 the new license was issued in August of 2016, and
14 it's for 30 years. The – let's see.

15 **COMMISSIONER WHITFIELD:** Excuse me. What year
16 was that, again?

17 **MR. JEFF LINEBERGER [DUKE]:** 2016, yes, sir,
18 and it's for 30 years.

19 **COMMISSIONER WHITFIELD:** Okay.

20 **MR. JEFF LINEBERGER [DUKE]:** Okay. We don't
21 actually have the little icons on there for both of
22 the projects. There's the 99 Islands Project,
23 which is about where you see the Broad River arrow
24 pointing. There's another one on the Broad River
25 just upstream of there, called Gaston Shoals. That

1 hydro station – Gaston Shoals Hydro is in South
2 Carolina, but the reservoir extends on up into
3 North Carolina; it's one of those that's shared.
4 Both of those were relicensed in 1996 for 40 years,
5 so they expire in 2036.

6 You move on to the right, you'll see Catawba-
7 Wateree. And as we've talked about, it has 11
8 reservoirs, some in North Carolina, some in South.
9 Lake Wylie is in the middle there, and it straddles
10 the Carolinas. That license – or, it was
11 relicensed in 2015 for 40 years, so it expires in
12 2055.

13 And that's all of the ones that actually have
14 facilities in South Carolina.

15 **COMMISSIONER WHITFIELD:** In South Carolina.

16 **MR. JEFF LINEBERGER [DUKE]:** Yes, sir.

17 **COMMISSIONER WHITFIELD:** That's good enough,
18 certainly. Appreciate your answers on that.

19 Based on your answer, Mr. Gharthey-Tagoe, with
20 being 10 percent – I know several years ago I saw
21 some numbers on some of the Duke hydro, and I know
22 some of the ones were phased out on a long list you
23 had in the IRP, like Buzzards Roost, places like
24 that, were sold off, what have you. That number is
25 a little bit higher, considering renewables being a

1 big word this day. I'm a little bit surprised it's
2 that high – and glad to hear it, actually. But
3 would you say, for your purposes – of course, 10
4 percent's, again, a bigger number than I was
5 expecting. But would you say a lot of your hydro
6 is for emergency purposes? Or to meet peak? Could
7 you define or split those out as far as generation
8 needs? Or is it for both?

9 MR. KODWO GHARTEY-TAGOE [DUKE]: I'd say both.
10 I'd call on Jeff or Randy to –

11 MR. RANDY HERRIN [DUKE]: Yeah, so, certainly,
12 on a daily basis, the facilities are meeting peak
13 demand. They run at a capacity factor, you know,
14 around mid-20s, 20 percent range, in that range.
15 Mid- to low 20s. So we're not – you know, we're
16 not blessed with a lot of water, or, you know,
17 inflows. So they're, on a daily basis, meeting the
18 peak demand. They also do provide emergency
19 response to the grid. They do provide black-start
20 at many of our sites, so if there's a system
21 emergency on the grid, we can restore the grid
22 working through our hydro facilities.

23 COMMISSIONER WHITFIELD: As far as age goes,
24 you described the dam in Rock Hill around 2004, so
25 certainly in terms of seniority, I would say you're

1 talking about that would be the oldest, probably
2 with Lake Wateree Hydro Station being possibly the
3 second oldest in that system?

4 **MR. RANDY HERRIN [DUKE]:** Actually, Lake
5 Wylie, that dam was replaced during the – after the
6 Great Flood of 1916. We rebuilt the powerhouse, so
7 the new facility is called Wylie Hydro. And we
8 totally rebuilt the dam; it's taller than it was
9 originally in 1904. So that facility now is a
10 1925.

11 On the Catawba-Wateree, Lookout Shoals, which
12 is in North Carolina, is – the oldest?

13 **MR. JEFF LINEBERGER [DUKE]:** So, Lookout
14 Shoals is the oldest in North Carolina. The oldest
15 in South Carolina is Great Falls, completed in
16 1907. Wateree was completed, I believe, in 1919.
17 So, the 19-teens and '20s were big hydro
18 construction years, lots of places in the
19 Southeast.

20 **COMMISSIONER WHITFIELD:** And thank you for
21 that. I certainly appreciate his original
22 statement on the history of this, as well. And
23 that gives us some perspective, but, again, back to
24 today. If you could, just for a second, shift to
25 page 15, and then I want to go to page 12 and I

1 think we'll about wrap up here.

2 [Reference: Presentation Slide 15]

3 On page 15, your green graph shows Wateree
4 over – the part you have circled – shows Wateree
5 over full pool, 100.0. It also shows Lake James, I
6 believe, at full pool, as well. And when you see
7 that point at Lake James, of course, that exceeded
8 full pool very sharply, but it also comes down very
9 sharply. And I think what is concerning, on
10 Wateree, is how long it takes – and I think you
11 mentioned, Mr. Lineberger, in your presentation,
12 that particular one was about seven or eight days,
13 I believe you said. And during that time, a lot of
14 things happen, which I'm sure you're aware of. And
15 I'm talking about destruction of property and all
16 kind of damage: homes, properties, docks, debris
17 that's harmful. All kind of things happening
18 there. My question to you would be – and I did
19 hear you say, and I was encouraged to hear you say
20 that you are adding to the ability to flow through
21 more water, faster, at Wateree, and you used the
22 analogy of some pools. But questions along these
23 lines are: How much would gates or locks cost for a
24 dam like Wateree, like you have in the other 11
25 reservoirs, going upstream – and I know you have

7/23/18

1 Fishing Creek, Cedar Creek at Great Falls, you have
2 Great Falls. And all those, you seem to open and
3 mechanically operate very well, but at Wateree
4 there is no way to let it out. And what you show
5 on page – and I’m just going to refer to page 12.
6 What you showed on page 12 continues for quite some
7 time, until things get back to normal. And I guess
8 my question is, if you had gates or locks, couldn’t
9 you better effectively manage the timing and
10 generate – as you said, that water is money in the
11 bank. Couldn’t you effectively generate
12 electricity more to your control, if you had gates
13 or locks there? And I realize this is an old dam,
14 but I’d certainly love to hear your thoughts and
15 answers to that.

16 **MR. RANDY HERRIN [DUKE]:** Sure. Certainly, I
17 wouldn’t say that it would give us any additional
18 generation. I mean, you know, the current design
19 of Wateree allows for that pool to go to full pond
20 and even over. We’re generating the whole time
21 that water is above full pond, so we’re generating
22 every unit at maximum output throughout the storm.
23 So we’re doing everything –

24 **COMMISSIONER WHITFIELD:** You’re generating –
25 not to interr- – you’re generating the whole time

1 it's going, but you're still –

2 **MR. RANDY HERRIN [DUKE]:** And –

3 **COMMISSIONER WHITFIELD:** – still letting money
4 flow out of the bank that you're not generating; is
5 that not correct?

6 **MR. RANDY HERRIN [DUKE]:** Well, but if your
7 question is adding gates – if we added gates, like
8 you're referring to it, to gain additional storage,
9 it would raise the lake, and we can't raise the
10 lake because then we'd be in the same situation
11 we're in with the water level when it spills over.
12 You know, if we raise the lake a foot or two or
13 three, it's going to be an issue with lake owners.
14 So, the footprint of the lake, full pond, is – or,
15 on Lake Wateree, elevation 225.5 is the project
16 boundary, so that's as high as the lake, you know,
17 can be from a design perspective. We're adding
18 floodgates or additional spillway capacity of
19 10,000 cubic feet per second, is what's required in
20 the license. We are currently evaluating how to do
21 that, what is the most economically feasible way to
22 install that capacity –

23 **COMMISSIONER WHITFIELD:** I was going to ask
24 that question.

25 **MR. RANDY HERRIN [DUKE]:** – so we haven't

7/23/18

1 actually nailed that down yet. We're currently in
2 the very early stages of that design. As Mr.
3 Lineberger mentioned, we just received the license
4 in 2015 for Catawba-Wateree and it was under appeal
5 for a year. We just exhausted the appeal process,
6 March of 20- -- this year. So we are -- now we're on
7 go to do the project, and so we're just starting
8 the process.

9 It's a very complex project. We want to
10 design it to, obviously, you know, meet the needs
11 of our customers, minimize the costs, to protect
12 lake owners, so we'll be evaluating that over the
13 next, probably, year, just to determine what's the
14 most feasible way to do that.

15 **COMMISSIONER WHITFIELD:** And from an
16 engineering standpoint -- that's what I was going to
17 ask -- without raising the lake levels, other than
18 what you're looking at now, is there no other way
19 to put some type of gate or control -- and I don't
20 know exactly where you're going with this --

21 **MR. RANDY HERRIN [DUKE]:** We -- you could add
22 another powerhouse, another generating asset to the
23 lake, put it on the opposite bank -- would be one
24 means. But, you know, just from our -- we've
25 actually looked at that, at a very high level,

7/23/18

1 preliminary high-level analysis, and the cost was
2 just cost-prohibitive for the amount of power that
3 we'd get out, because we've still got the existing
4 facility that can manage the flow and generate the
5 power, you know, 99.9 percent of the time. So it
6 would be additional capacity that wouldn't –
7 there's not sufficient water to support it, except
8 on – if you look at the chart –

9 [Reference: Presentation Slide 17]

10 If you look at page 17, for example, you know,
11 there were three excursions where, basically, you
12 know, having that additional generation would have
13 paid off. Currently, our plan is to do it through
14 some type of spillway enhancements.

15 **COMMISSIONER WHITFIELD:** Certainly, Mr.
16 Herrin, and that's where I was going, in terms of
17 generation that would benefit Duke DEC ratepayers.
18 As you well know, most of the lake owners are not
19 DEC ratepayers. Some are, but most are not, and
20 aren't customers of yours. But, certainly, you can
21 certainly recognize the PR issue that Duke has when
22 these things happen, and I'm sure you're well aware
23 of that, but I wanted to stick to the generation.
24 And I certainly appreciate your answers, and
25 certainly hope that something will be done soon and

7/23/18

1 that you can come back to us and tell us when you –
2 very soon, hopefully – what's your direction you're
3 going to go in, because that's been a long – I just
4 think it would be beneficial to the ratepayers, as
5 well as the citizens. And I certainly appreciate
6 your answers and look forward to seeing what you
7 come up with. Thank you.

8 Thank you, Mr. Chairman.

9 **CHAIRMAN RANDALL:** Thank you.

10 Commissioner Hamilton.

11 **COMMISSIONER HAMILTON:** Thank you, Mr.

12 Chairman.

13 Gentlemen, I've enjoyed your discussion and
14 your presentation. I wanted to move, if you could,
15 back to page three. Mr. Lineberger, probably we'll
16 start with you, but I've heard little about the
17 Yadkin-Pee Dee today, and of course that's very
18 important to me. For many years, I was involved in
19 the area in industrial development, and we were
20 always concerned about the water level getting
21 across the South Carolina line, and because of the
22 industry that we've been able to put on the Pee
23 Dee. Tell me a little bit about – we haven't heard
24 much about it today.

25 **MR. JEFF LINEBERGER [DUKE]:** Yes, sir. And

7/23/18

1 that's not by design. Our assets on the Yadkin-Pee
2 Dee are just as important to us. We do have a new
3 license over there, as well, that has a higher
4 continuous minimum flow requirement in it, and it
5 basically requires us to run one of our hydro units
6 at Blewett Falls all the time, and sometimes to run
7 more than one.

8 We also have a low-inflow protocol over there
9 that provides some direction for those inevitable
10 times of drought. So from the standpoint of water
11 passing into South Carolina, it's another place
12 where this low-inflow protocol and new license has
13 given a safety net to the folks downstream that
14 need that water. And I'm sure you probably recall
15 how things were in the '98-'02 drought over there,
16 and that was tough. It was tough times. There
17 wasn't a whole lot of coordination with the Alcoa
18 Projects upstream. And we, through the relicensing
19 process and the approach that's been taken there,
20 that coordination is there now. That low-inflow
21 protocol gives the direction to the operator of
22 those four upstream hydros, as well. So it's
23 another place where the outcome has been very
24 positive.

25 You can still get into droughts where you just

7/23/18

1 don't have enough water to ever make it work. You
2 know, if it stops raining, we all are in bad shape.
3 But I feel confident that we're in a good place for
4 all interests on that river now, a much better
5 place than we were.

6 **COMMISSIONER HAMILTON:** Okay. Thank you sir,
7 very much. I appreciate hearing that.

8 Thank you, Mr. Chairman.

9 **CHAIRMAN RANDALL:** Thank you, sir.

10 Commissioner Howard.

11 **COMMISSIONER HOWARD:** Good morning. I, too,
12 enjoyed your presentation. I live on a lake. A
13 couple of these questions might be parochial. But
14 do you have other candidates – you talked about
15 raising your megawatts at one of your plants. Are
16 there any other plants a candidate for raising
17 megawatts?

18 **MR. RANDY HERRIN [DUKE]:** Yeah. The site that
19 I mentioned, which is in South Carolina, is –

20 [Reference: Presentation Slide 10]

21 – the Bad Creek Station where we're going to
22 raise it 335 megawatts. Jocassee Station, which is
23 downstream of Bad Creek, we've already taken
24 advantage of upgrading those units. We've added
25 100 megawatts at those sites – I'm sorry, let me

7/23/18

1 back up. I believe it was 80 megawatts of
2 generation, 100 megawatts of pumping capacity.
3 We've also upgraded many of these facilities over
4 the last 20 years, specifically up and down the
5 Catawba-Wateree River System.

6 There are still some limited opportunities,
7 but we've just about exhausted most of them. Most
8 of the sites in South Carolina have already been
9 through the upgrades.

10 **COMMISSIONER HOWARD:** I'm relying on my
11 memory, which is pretty weak, but several years ago
12 when we first came on the Commission, SCE&G had – I
13 don't know what they – I'll call it re-
14 strengthening or they redid their dam. It was a
15 big project.

16 **MR. RANDY HERRIN [DUKE]:** Yeah.

17 **COMMISSIONER HOWARD:** And in my mind, it was
18 something like to make the earthquake-proof better,
19 or something. Are any dams – was that a FERC
20 requirement? And I'm sure it was, but do all your
21 dams meet that requirement?

22 **MR. RANDY HERRIN [DUKE]:** You're correct, it
23 was a FERC requirement. It was called a seismic
24 stability analysis. It showed some of our dams
25 needed to be strengthened or remediated. In

7/23/18

1 particular, Wateree Dam has already been done.
2 That was done back in the 2000s. So Wateree has
3 been done.

4 We currently have three dams that still remain
5 to be done in that program. We are working on one
6 of those right now. It's on the Lake James
7 impoundment; it's called Linville Dam. That
8 project is underway. Once we complete that, we
9 have Lake Lookout Dam which follows, and then
10 Mountain Island Dam after that. And that will
11 complete that program.

12 **COMMISSIONER HOWARD:** Is there a timeline on
13 that? Did FERC put a timeline on it?

14 **MR. RANDY HERRIN [DUKE]:** There is a timeline.
15 We work them in series, so once we complete one we
16 move to the other. And I could not quote you the
17 end date off the top of my head, without sitting
18 down and looking at a calendar and going through
19 it.

20 **COMMISSIONER HOWARD:** As a lakefront owner,
21 it's some concern to me, but there's conversation
22 about the utilities – and, in my case, Santee
23 Cooper – in your situation lowering the lake level
24 by design in the winter, to eliminate winter
25 storms, and also a sideline is to give property

7/23/18

1 owners a chance to fix seawalls and docks. In
2 looking at your page 17, your lowest levels were
3 during the winter. Is this any truth to that, or
4 any –

5 [Reference: Presentation Slide 17]

6 **MR. RANDY HERRIN [DUKE]:** Our reservoir levels
7 do have target elevations that typically go down
8 towards the winter months. You know, we get less
9 storm – less inflow in the fall and early winter,
10 and so, essentially, we're using storage as we work
11 our way down, and we typically work that down, and
12 so we have different target elevations for
13 different seasonal times of year. And then, as you
14 start a new year, you start getting into the
15 spring, that's our heavy inflow time, so we try to
16 have the reservoirs in a position to absorb that
17 inflow during that period of time.

18 But, now, we will do planned draw-downs at
19 times. It could be maintenance that we need to do
20 on a unit and, if we're going to do maintenance
21 then we need to do a planned draw-down, then
22 typically we would announce that to the lake owners
23 so that they could take advantage of that time, as
24 well, if they need to do maintenance. But it's not
25 that we systematically pull down every, you know,

7/23/18

1 winter for maintenance. It's a seasonal thing,
2 based on inflow.

3 **COMMISSIONER HOWARD:** What role, if any, does
4 evaporation play in your planning process?

5 **MR. JEFF LINEBERGER [DUKE]:** Want me to cover
6 that?

7 **MR. RANDY HERRIN [DUKE]:** [Indicating.]

8 **MR. JEFF LINEBERGER [DUKE]:** For the Catawba
9 system, it's significant. On a hot summer day, the
10 total surface area, full pond, of those 11
11 reservoirs is about 80,000 acres on the Catawba.
12 On a hot summer day, the natural evaporation can be
13 over 300 million gallons a day from that combined
14 lake surface, which is more water than is used by
15 all of Duke Energy's thermal plants and the 18
16 public water utilities – more water than is
17 consumed by them, combined. So we have to plan for
18 evaporation. And we've done that in the long-range
19 water supply planning, and we have also considered
20 climate change there, because if it gets hotter in
21 future decades, that's just going to increase that
22 natural evaporation.

23 It is a significant water demand and, in many
24 cases, it's the highest water demand when you're
25 modeling total water quantity in that reservoir

7/23/18

1 system. It's a big deal.

2 COMMISSIONER HOWARD: Thank you, very much.
3 And, again, I enjoyed your presentations.

4 MR. JEFF LINEBERGER [DUKE]: Thank you, sir.

5 CHAIRMAN RANDALL: Commissioner Ervin.

6 COMMISSIONER ERVIN: Thank you, Mr. Chairman.

7 Gentlemen, thank you for being with us this
8 morning and for your informative presentation.
9 Where are the geothermal plants located? I believe
10 you said you had a couple in the system. Do you
11 know where they're -

12 MR. JEFF LINEBERGER [DUKE]: I think that - I
13 probably said "geothermal"; I meant thermoelectric.

14 COMMISSIONER ERVIN: Thermoelectric.

15 MR. JEFF LINEBERGER [DUKE]: That's our steam
16 plants. That's - on the Catawba, it's Marshall
17 Steam Station, Catawba Nuclear, McGuire Nuclear,
18 and Allen Steam Station. Yes, sir, that's what I
19 was referring to.

20 COMMISSIONER ERVIN: The other thing I wanted
21 to ask about: You said at certain times, when lake
22 levels are low, that there's some seepage of the
23 lake into groundwater. Do you know what percent we
24 lose to groundwater?

25 MR. JEFF LINEBERGER [DUKE]: I don't know what

1 percent. I know it's erratic, as well, and the
2 time that we really saw that was in that four-year-
3 long drought from '98 into 2002. When you started
4 accounting for all the known demands on the water,
5 we were losing water at a greater rate, and the
6 only place left is that interface with the
7 groundwater.

8 **COMMISSIONER ERVIN:** Do you all coordinate
9 with South Carolina Water Resources, or any other
10 State agency, as it relates to your operation.

11 **MR. JEFF LINEBERGER [DUKE]:** Yes, sir, we do.
12 South Carolina Department of Natural Resources is
13 heavily involved in our relicensing process. They
14 participate on our drought management advisory
15 groups, and they also have been a partner for the
16 Catawba-Wateree Water Management Group, helping us
17 fund things like that Water Supply Master Plan.
18 They're right there with us.

19 **COMMISSIONER ERVIN:** You mentioned the problem
20 with sediment taking away capacity. Is there any
21 effort or attempt with you or with any of your
22 partners to monitor and try to mitigate sediment
23 into the lake system?

24 **MR. JEFF LINEBERGER [DUKE]:** The answer is yes
25 to both. We have – we did a monitoring project, if

7/23/18

1 I remember right, on six of the reservoirs a few
2 years ago with the Catawba-Wateree Water Management
3 Group. It was a five-year evaluation of
4 sedimentation rates at major tributaries. We plan
5 to do that again in about five more years.

6 We also have a project going on right now that
7 is jointly funded between the Water Management
8 Group and the Water Research Foundation, which is a
9 national organization, that is evaluating the
10 impact on sedimentation rates, on water quantity,
11 and quality, of conserving targeted additional
12 lands in the Catawba Basin. So it's – again, we're
13 all about science. You have to – if you're going
14 to make big investments, you have to have some good
15 idea that it's actually going to work. But what
16 we're doing there is trying to identify just how
17 much of an impact would it be? How much of a
18 benefit would it be? And we've got the land
19 conservation community right there working with us
20 on the project. So, hopefully, in the end, we're
21 going to identify some places that, if we focus
22 some resources on them and got them conserved, that
23 it would slow down that sedimentation rate.

24 **COMMISSIONER ERVIN:** I commend your efforts on
25 that, and I know around some of the lakes,

7/23/18

1 particularly with new construction, there seems to
2 be a lot of sediment runoff that's not being
3 monitored. I don't know – it's probably not your
4 responsibility until it crosses your right-of-way,
5 but is there any coordination with county
6 government in terms of that, to monitor?

7 **MR. JEFF LINEBERGER [DUKE]:** There is. Our
8 Lake Services staff, anything that crosses into
9 that FERC project boundary, we have to issue a
10 permit for it. So we have permitting programs that
11 we manage. Lake Services representatives manage
12 those. And they coordinate with either the county
13 that has the buffer ordinances or, in some cases,
14 those buffer ordinances are managed by the State.
15 So when we see violations of a buffer ordinance, we
16 work with those entities, whoever the entity is
17 that has the regulatory authority, to try to
18 address that. And in some cases we have required,
19 where there was a significant influx of
20 sedimentation from a construction project, we've
21 required the entity that was doing the construction
22 to get that sediment out of the lake, but there has
23 to be a mechanism for us to do that. So if the –
24 wherever the sedimentation came from, if they also
25 had to have a lake-use permit from us, then that's

7/23/18

1 the mechanism that we would use to correct the
2 problem.

3 **COMMISSIONER ERVIN:** Very good. Finally, you
4 mentioned there are some targets that you maybe
5 have considered or evaluated to add to the hydro
6 capacity. Do you still own the one up in my area
7 near, I think it's – it's between Honea Path and
8 Greenville County. It's an old hydro plant there
9 on the Saluda River.

10 **MR. JEFF LINEBERGER [DUKE]:** That's probably
11 the Saluda Hydro –

12 **COMMISSIONER ERVIN:** Yes, sir.

13 **MR. JEFF LINEBERGER [DUKE]:** – Station. No,
14 sir, we sold that in 1996 or '97.

15 **COMMISSIONER ERVIN:** So it's no longer in use?

16 **MR. JEFF LINEBERGER [DUKE]:** That's correct.

17 **COMMISSIONER ERVIN:** It's just – Buzzards
18 Roost was sold down there in Laurens County, too, I
19 believe, wasn't it?

20 **MR. JEFF LINEBERGER [DUKE]:** Yes, now, we
21 actually had Buzzards Roost Hydro Station leased.
22 Greenwood County owned it, but we were leasing it
23 from them, and we no longer lease that.

24 **COMMISSIONER ERVIN:** Is it in your capacity
25 now, or is it being utilized by someone?

7/23/18

1 **MR. JEFF LINEBERGER [DUKE]:** Santee Cooper.

2 **COMMISSIONER ERVIN:** Santee Cooper.

3 **MR. JEFF LINEBERGER [DUKE]:** Yes, sir.

4 **COMMISSIONER ERVIN:** Thank you.

5 **CHAIRMAN RANDALL:** Is that all, Commissioner?

6 **COMMISSIONER ERVIN:** Yes, sir.

7 **CHAIRMAN RANDALL:** Commissioner Whitfield, I
8 think you said you had one more short question.

9 **COMMISSIONER WHITFIELD:** I do. I do have a
10 follow-up for you, Mr. Lineberger, and I think it
11 was you, and I meant to ask you this earlier. You
12 had mentioned that, when the rainfall – a lot – the
13 rainfall occurs up in the North Carolina area, even
14 above Charlotte, and then, of course, may not even
15 have little if maybe none, no rainfall down around
16 the Catawba-Wateree area, and yet you feel the
17 effects, obviously, because it's downstream. In
18 the interim, from what you've suggested that you're
19 looking into at the Wateree Dam, in the interim, is
20 it possible that the company could pay special
21 attention to the gates and locks above, like, Great
22 Falls, Fishing Creek, and possibly staying on top
23 of those, to mitigate what happens at Wateree as
24 things come downstream, for lack of a better word,
25 from Charlotte and north of Charlotte? And I know

7/23/18

1 you talk about one day of damage, but nobody wants
2 one day of damage. But when there's seven or eight
3 days, people say, "Well you're already wet." Well,
4 no, prolonged water damage, as you know, makes
5 things a lot worse. And I just wonder if there's
6 anything you could do about your gate management in
7 those upstream locks and dams, particularly the
8 ones right above Wateree and maybe even on upstream
9 further up the Catawba System. Is there anything
10 you might offer there?

11 **MR. RANDY HERRIN [DUKE]:** Yeah, I think I'm
12 the one who mentioned that, previously.

13 **COMMISSIONER WHITFIELD:** Yes, sir, I believe
14 you were.

15 **MR. RANDY HERRIN [DUKE]:** Yes, I tried to
16 illustrate that we do take advantage of all storage
17 when we're in the high-flow events.

18 [Reference: Presentation Slide 15]

19 So, if you look at Slide No. 15, you know,
20 what this illustrates – and we just picked two
21 reservoirs. We picked Lake Norman and we picked
22 Lake James. But what it shows is, in those cases,
23 we're taking advantage of the storage on Lake
24 Norman. Lake Norman is our largest reservoir. It
25 is the biggest buffer that we have for, basically,

7/23/18

1 helping us manage high-water or flood situations.
2 It's also our largest for managing drought
3 situations. So, you know, that reservoir's a
4 tremendous asset for all of us.

5 And we essentially use all storage available
6 to minimize that impact on Lake Wateree. So, you
7 know, we will attempt to have the reservoirs in the
8 right positions, as I mentioned earlier. We will
9 do advance drawdowns, if necessary, to make room in
10 a reservoir, so that we can gain additional runoff
11 during storm systems. Here again, that's
12 predictive, so, you know, it's not an exact
13 science, because we don't know exactly what the
14 weather is going to do, but we attempt to, you
15 know, make adjustments accordingly.

16 So we are currently using all available
17 storage with those gated facilities. It just
18 appears like, you know, to the folks on Lake
19 Wateree – you know, they are seeing the same flow
20 plus additional flow, because you've got the
21 Fishing Creek tributary that's coming in beyond the
22 Fishing Creek reservoir, so that's coming as well.
23 Rocky Creek is coming into the Wateree also. So
24 you've got those additional tributaries downstream
25 of Fishing Creek.

7/23/18

1 **COMMISSIONER WHITFIELD:** As you have Lake
2 Wylie and Lake Norman properly released, for lack
3 of a better word, how much leeway do you have in
4 the Catawba River – and I’m speaking specifically
5 of Fishing Creek and Great Falls – to mitigate?
6 Once those lakes are under control, for lack of a
7 better word, how much leeway or elastic do you have
8 in the – because you’ve got a long river system
9 there for a while. Is there –

10 **MR. RANDY HERRIN [DUKE]:** Yeah. Well, like we
11 say, we’ve got 11 reservoirs. All the water’s
12 going to wind up – you know, it winds up at Lake
13 Wateree, eventually. As far as – you talking about
14 travel time? How long it takes to –

15 **COMMISSIONER WHITFIELD:** Yeah, well, it looks
16 like if you close Fishing Creek quick enough that
17 that mitigates it. I mean, I’m –

18 **MR. RANDY HERRIN [DUKE]:** Well, but, you know,
19 Fishing Creek’s a gated facility, and 100.0 is full
20 pond, and it can’t go above full pond because it is
21 gated and we have to maintain those gates as
22 operational. So we can’t have debris going over
23 them that jams up the floodgate system to where
24 they don’t work, or then we don’t have an operating
25 – or, the dam is not operating properly. It’s

1 critically important that we operate those dams in
2 accordance with the FERC regulations, from a dam-
3 safety standpoint, because we don't want to put the
4 dam at risk.

5 **COMMISSIONER WHITFIELD:** Certainly. Well, I
6 certainly appreciate your presentation.

7 Thank you, Mr. Chairman.

8 **CHAIRMAN RANDALL:** Thank you.

9 Mr. Melchers, I think you had a question.

10 **MR. MELCHERS:** Thank you, Mr. Chairman.

11 You've talked about the central operations hub
12 in Charlotte and how that allows you to coordinate,
13 particularly in significant rain events, the flow
14 of the water for safety, and such. As you sell
15 hydro assets, what type of control do you retain in
16 regard to coordination of assets that you no longer
17 own?

18 **MR. RANDY HERRIN [DUKE]:** So, the facilities
19 that we sell, we do not retain control of the water
20 levels, the flow rates, or any aspects of it. If
21 you're referring to the facilities that we do have
22 for sale currently, we are – two of them are in –
23 actually, one is in South Carolina, Gaston Shoals,
24 and the other facilities are all in North Carolina:
25 Mission, Bryson, Franklin, and Tuxedo Station.

1 So we would not maintain control of the water
2 above or at those facilities. Gaston Shoals does,
3 and Tuxedo, basically discharge down the Green
4 River, down the Broad River, to 99 Islands Station.
5 But 99 Islands is one of the few run-of-the-river
6 sites that we have. Pretty much, the Broad River,
7 you know, as far as the amount of water in it and
8 the size of those stations, there's typically
9 always units running at those facilities, so that
10 water will continue to come to them for generation.

11 **MR. MELCHERS:** Thank you.

12 **CHAIRMAN RANDALL:** Thank you.

13 Thank you, gentlemen. One quick question from
14 me. You were talking about water temperature,
15 evaporation, you know, monitoring, with climate
16 change. I know a few years back, warm water in
17 Lake Wylie caused a lot of buildup growth of stuff
18 in the intakes at the Catawba Plant. Does the
19 warmth and managing lake-water temperature – well,
20 you can't manage lake-water temperatures. But does
21 that make – do you have – does that present more of
22 a challenge as far as maintenance of what you've
23 got intakes on, especially on your steam plants?

24 **MR. JEFF LINEBERGER [DUKE]:** Yes, sir, it
25 does. What you're talking about, primarily, is

1 algae blooms. We do see more of those in the
2 summers that are hot, and particularly dry summers.
3 It does require some additional work, particularly
4 where we have cooling towers, like Catawba. We
5 provide a biocide in that cooling water that helps
6 reduce the buildup of growth on the heat-exchange
7 surfaces, but it can cause greater impacts there.
8 It can also cause impacts for the water utilities.
9 A lot of these algae, particularly when they die,
10 the raw water comes in through the lake, it's
11 processed at the water treatment facilities, but
12 taste and odor issues on the back end can be a
13 problem for those folks, requiring some chemistry
14 changes in their process.

15 One of the areas that the Water Management
16 Group is focusing on now – we've spent, really, the
17 first ten years of our collective effort on
18 quantity, primarily. We're now shifting that a
19 little bit to look harder at quality. And we've
20 got a water quality update to the Water Supply
21 Master Plan that's in the works right now, that
22 looks at things like algae blooms and like other
23 contaminants that may get into the lake system: Are
24 we doing enough together to monitor for those and
25 to help our folks that live and use the lakes to

7/23/18

1 not do things that would perhaps introduce those
2 things: things like being smarter about how you
3 fertilize in areas that are close to the water
4 body? Be careful with that stuff, and understand
5 that any chemical applied the wrong way in the
6 watershed can eventually be a problem in the lake.

7 **CHAIRMAN RANDALL:** Thank you. Gentlemen, I
8 appreciate you being here today. Thank you for a
9 very informative presentation.

10 Ms. Shirley Smith, have you got anything else?

11 **MS. SMITH:** No, sir.

12 **CHAIRMAN RANDALL:** Ms. Pittman?

13 **MS. PITTMAN:** Real brief, I just appreciative
14 everybody following the rules today, and I would
15 ask all the attendees to please submit their
16 verification forms before leaving today.

17 **CHAIRMAN RANDALL:** Thank you, ma'am. Please
18 do that.

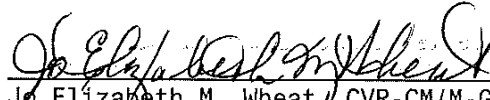

19 If there's nothing else, we're adjourned.
20 Thank you.

21 [WHEREUPON, at 11:38 a.m., the
22 proceedings in the above-entitled matter
23 were adjourned.]

C E R T I F I C A T E

I, Jo Elizabeth M. Wheat, CVR-CM-GNSC, do hereby certify that the foregoing is, to the best of my skill and ability, a true and correct transcript of all the proceedings had in an Allowable Ex Parte Proceeding held before THE PUBLIC SERVICE COMMISSION OF SOUTH CAROLINA in Columbia, South Carolina, according to my verbatim record of same.

IN WITNESS WHEREOF, I have hereunto set my hand, on this the 24th day of July, 2018.

Jo Elizabeth M. Wheat, CVR-CM/M-GNSC
Hearings Reporter, PSC/SC
My Commission Expires: January 27, 2021.

7/23/18
